

# Code Breaker - Count Me Up

// Sparking Challenge Code Breaker

## Example

Your code should have the following output:

```
countLetterOccurrences("heLL000o")  
> { L: 2, O: 3 }
```

## Description

We now have the total number of uppercase letters! Let's continue by counting the number of occurrences of each uppercase letter in the ciphertext. We will store the values in a **map** so that we can use it later on.

You are to:

- Create a function that counts the number of occurrences of each **UPPERCASE** letter. This function will return a **map** with a **key** for each letter with it's count as the **value**.
